

General GemsTracker information

The GemsTracker software, allows organizations to have their own secure data collection site where data can be accessed, submitted and modified. GemsTracker can be seen as a 'toolbox' for setting up your own data collection system. Normally one site corresponds to one research study but it is also possible to run multiple studies on one site simultaneously. Additionally, different organisations can use the same site but share the same measurement tracks. In this case data for each organization is separately stored and visualized for it's users. This way, a GemsTracker site is used as a (national) database for quality registrations or research. For each organization the GemsTracker site can be modified according to the style and required functionality of the organization.
