

# Making Lime Survey questionnaires more adaptive to changes in data collection:

1. possibility to hide answer options (vertically and horizontally, also in array questions). Please make sure the code is added to the LimeSurvey layout template. By putting `-/-` before an answer option, it is hidden in the interface, while data structure is maintained. Link to code that implements this in the template can be found [here](#).
2. Insert hidden questions inbetween existing ones so when you want to alter questionnaires, you might only have to change answer options and unhide them.
3. Add a few hidden equation questions at the end of your questionnaire. They can be used to insert computed scores from a php script running in Gemstracker (an after answer event code).
